

CS112
Assignment 4
Deadline **25 April 2022**

You can submit this assignment in a group of 2 students

Problem Statement

Description

In this assignment you are required to implement a class which will encapsulate C++ strings. This class will contain member functions to manipulate and access the string in various ways. A great deal of functionality will be implemented using C++ operator overloading.

Requirements

1. The character array (which is used to store the string) should be **dynamic** in nature. Assume a default size of 50 bytes.
2. Your class must have following constructors:
 - a. Default constructor
 - b. Constructor which accepts a character array
 - c. Constructor which takes the size of string
3. Implement class destructor.
4. Function which returns the size of string.
5. Function which returns the size of character array.
6. Overload all the operator, mentioned in Table 1.
7. In main function, test all operations/functions of the string class. Print string(s) before and after every operation.

Note: Do not use C/C++ string library functions.

```
// Assume that above mentioned class is implemented as
```

```
// CMyString
```

```
CMyString a ("ABCDEFGH");
```

```
CMyString b ("1234567");
```

Table 1: Operators

Operator	Usage/Operator	Example
+	String concatenation	<pre> CMyString c; c = a + b; // c = "ABCDEDEG123456" </pre>
+=	String concatenation	<pre> a += b; // a = "ABCDEDEG123456" </pre>
[]	Get/Set individual characters	<pre> char d = a [1]; // d = 'B' b [4] = '1'; // b = "123416" </pre>
==	Test string equality	<pre> bool t = (a == b); // t = false bool p = (a == a); // p = true </pre>
!=	Test string inequality	<pre> if(a != b) // Condition true { } </pre>
>	String comparison	<pre> if(a > b) // Condition true { } </pre>
<	String comparison	<pre> if(a < b) // Condition false { ... } </pre>

		... }
()	Get sub-string	CMyString c; c = a (0, 3); // c = "ABCD"
<<	Print string using ostream	cout << a << b;
>>	Input string using istream	cin >> a;
=	String assignment	b = a; // b = "ABCDEFGH"
<<	String left shift	CMyString c; c = a << 1; // c = "A" and a = "BCDEFG" c = a << 3; // c = "BCD" and a = "EFG"
>>	String right shift	CMyString c; c = a >> 1; // c = "G" and a = "ABCDEF" c = a >> 3; // c = "FED" and a = "ABC"
